

Opening and refill mechanism.

Sequence 1: Opening

The product is 24 mm in height and 24 mm at its widest point.

The product is opened at the top by applying pressure to the top and twisting anti clockwise.

The top is then removed.

Sequence 2: Refilling

Once removed the liquid can be added using a bottle with a nozzle.

The nozzle should be no less than 9mm in length to ensure the liquid can be added without spillage.

Ensure the product is held at a slight angle to help ensure the liquid whilst being added does not enter the central tube.

Add the liquid until the 1.0ml mark is reached, at which point withdraw the nozzle.

Sequence 3: Closing

To close the product reapply the top.

Pressure is applied combined with clockwise twisting until tight.
